

## Feature/Functionality Changes & Updates

### Driveri Updates

- **New and Improved Fleet Admin Dashboard:** The user interface of the Fleet Admin tab on the Dashboard has been updated and enhanced to provide clear insights. Actionable tasks for fleets are now prominently displayed, enabling fleet managers to easily identify areas needing their attention. It offers a comprehensive summary of device health, RMA status, device utilization, and an overview of groups and vehicles. Additionally, users can easily filter information based on device variant for tailored device information.
- **Reports Central: Driveri Health Report:** The Device Health Report, Active Vehicle Device Association Report, and Active Device Report have now been combined into a single, all-inclusive Driver.i Health Report, providing a comprehensive analysis of your fleet's performance and device/vehicle status. This report includes two sections. The 'Overview' section lists actionable devices within the fleet, along with device utilization and performance data. The 'Device Status' section provides details about active devices, devices under investigation, non-functional devices, RMA status of devices, and vehicle status with their associated device information.

**Note.** The Active Device Report and Active Vehicle Device Association Report will be discontinued and users who have subscribed to these reports will automatically be subscribed to the new report.

## Bugs Squashed - Fleet Tracking Portal

### Alerts

- Fixed an issue preventing the editing of new or existing maintenance alerts when certain alert threshold fields were left blank.
